Cibin Mathew Simon

Full-stack Solution Architect · Cloud ERP & eCommerce · Java + Angular

cibinmathewsimon@gmail.com · linkedin.com/in/cibin-mathew-simon · cibinmathewsimon.github.io · Kerala, India

PROFILE

Full-stack Solution Architect with 8+ years at Rappit, growing from developer to architect on cloud-based ERP and eCommerce platforms for European clients. I design back-end-heavy systems with Java, Spring Boot and Angular on Google Cloud, favouring pragmatic architecture: a modular monolith when speed to market matters, events at the seams, and data-driven designs that let the business change behaviour without a release. Recent work includes an in-store furniture commerce platform that went from first requirement to production in under six months, and the portfolio migration of ~20 enterprise applications through a corporate demerger.

CAREER AT RAPPIT

Associate Solution Architect II	Jan 2026 – Present
Associate Solution Architect I	Feb 2024 – Dec 2025
Technical Lead	Jan 2023 – Mar 2024
Team Lead	Jan 2022 – Feb 2023
Software Engineer	Jan 2020 – Jan 2022
Associate Software Engineer	Jun 2018 – Jan 2020

IN-STORE FURNITURE COMMERCE PLATFORM

European home-furnishing retailer · Technical Architect Jun 2025 – Present

An iPad progressive web app used by sales staff in the showroom to configure custom furniture with customers and sell it directly. It replaced a 1990s DOS-based configuration system and is live in 3 stores.

Team	Team of 8: technical architect (me), delivery manager, front-end lead, front-end developer, 3 full-stack developers, tester.
Stack	Java 21, Spring Boot, Angular PWA, PostgreSQL, Elasticsearch, Redis, BigQuery, Google Pub/Sub, Cloud Run, GitLab CI, Cloud Logging & Monitoring

What I did

- Architected a data-driven platform on Java 21, Spring Boot, Angular PWA and GCP Cloud Run, from first requirement in Jun 2025 to production in Nov 2025, as a modular monolith (PIM + Sales: ordering, discounts, delivery, payments, contracts) built to split into microservices for a future warehouse and ERP phase.
- Designed the data-driven product configurator and rule builder (guided flows and 2D drag-and-drop) that keeps every configuration consistent; 50+ suppliers onboarded, each with its own rule set, without code changes.
- Introduced event-driven integration with Google Pub/Sub across modules, stock monitoring, BigQuery analytics and an AI service that converts supplier brochures into structured product data.
- Cut product configuration time from ~60 min to 5–8 min; 100+ orders/day across 3 stores and growing; search under 500 ms with Elasticsearch.
- Technical architect for a team of 8; 3-week sprints with weekly or biweekly rapid releases via GitLab CI; works directly with the client, including on-site visits to the Netherlands.

Key architecture decisions

Modular monolith over microservices	A data-driven platform had to reach production in about six months with a small team. Clear module boundaries (PIM, Sales) keep a later split into microservices open for the planned warehouse and ERP phase.
Data-driven configurator and rule builder	Products, options and validity rules live in data, not code, so new suppliers and product ranges go live without a release. Supports both guided flows and a 2D drag-and-drop builder.
Events with Google Pub/Sub	Stock updates, analytics feeds and supplier imports are decoupled from the sales flow, so a slow consumer never blocks a sale in the store.

ENTERPRISE APPLICATION PORTFOLIO

Global chemical company headquartered in Europe · Developer → Team Lead → Technical Lead → Architect Jun 2018 – May 2025

Around 20 business applications on Java, Spring Boot and Angular on Google Cloud, built and maintained by a team that grew from 4 to 15 engineers.

Team	Team grew from 4 to 15 engineers; I moved from developer to architect working with junior engineers.
Stack	Java, Spring Boot, Angular, PostgreSQL, Firestore, BigQuery, Pub/Sub, Cloud Run, Cloud Functions, IAM, IAP, Cloud Armor, Load Balancing, GitLab CI

What I did

- Grew from developer to architect as the team scaled from 4 to 15 engineers.
- Led the portfolio migration through a corporate demerger: chose a strategy per application (decommission and rebuild, split, or duplicate) and migrated every application to the new company's GCP platform.
- Delivered applications across HR, document search and research dashboards, shareholder payouts, an internal eCommerce store, tank-level monitoring and an IoT data pipeline.
- Standardised CI/CD pipelines across the portfolio and optimised GCP running costs; mentored developers into team leads.

Applications

HR	HR platform for internal processes.
Data & research	Document search and analysis platform, research dashboards.
Finance	Shareholder application handling large payouts to shareholders.
Commerce	Internal eCommerce platform.
Industrial monitoring	Tank-level monitoring application.
IoT	Application processing high volumes of sensor data through a data pipeline.

SKILLS

Back end	Java 21, Spring Boot, REST APIs, domain-driven design, modular monolith, event-driven architecture, microservices design, integration patterns, retries & idempotency
Data	PostgreSQL, Elasticsearch, Redis, Firestore, BigQuery, data modelling, data pipelines
Cloud (GCP)	Cloud Run, Cloud Functions, Pub/Sub, Cloud Storage, IAM, IAP, Cloud Armor, Load Balancing, Cloud DNS, Logging & Monitoring, GKE (learning)
Security	OAuth2, Azure AD, Firebase Auth
DevOps	GitLab CI/CD, Docker
Front end	Angular, TypeScript, PWA

BEYOND DELIVERY

- Technical interviewer for engineering hires
- Runs internal training programmes for freshers
- Consistently recognised as a top performer

EDUCATION

B.Tech, Computer Science, SCMS School of Engineering and Technology, Kerala 2018 · CGPA 8.2/10
